

Space City

By David Li
Age 7

If everyone wants to live in space, I would design a space city for them. Spacecrafts will bring passengers to the space city. Each planet would have a spacecraft landing platform. Some special spacecrafts go to Earth to transport food to the space city. Earth would have three spacecraft landing platforms, one for passengers and two for food carriers. All planets except Earth would have tubes. The tubes are attached to the planets and they support the space houses. People who live in these houses also use those tubes to go down to the planets. Then, they drive their space cars to the parking lot at the spacecraft landing platform. From there, they wait for the next spacecraft to bring them to the space city. Each planet has fifty spacecrafts to come to the planet at different times. Spacecrafts come to a planet every five minutes.

I hope everyone will love my space city.
